

Deposition Aid/Drift Control Agent

Sedate™ is a deposition aid/drift control agent, that enhances the droplet spectrum of spray solutions without altering the viscosity. The percentage of fine droplets, which are the most susceptible to drift, is significantly reduced, thereby increasing deposition and reducing drift of the spray away from the target. Sedate™ will not significantly increase the number of extremely large droplets that reduce deposition. Sedate™ increases spray droplet retention on leaf surfaces while minimizing “bounce” and runoff.

Application Directions

The use rate for Sedate™ is 1 pint per 100 gallons of spray solution.

Sedate™ may be used with any glyphosate or similar active formulation that requires, recommends or allows the use of a deposition aid and/or drift control agent.

Package Size

Sedate™ is available in 4x1 gallon containers.

Principal Functioning Agents

Lecithin, Emulsifier and other ingredients.....	100%
TOTAL	100%

Always read and follow label directions.
